

1) find the gross salary using basic salary

basic salary = 20000

bonus = 20%

incentive = 5%

Algorithm

1) Start

2) Take the input of basic salary, bonus percentage, incentive percentage from the user,

3) calculate the bonus amount by convert bonus percentage into amount by using this formula.

$$b = \frac{\text{bonus percentage}}{100} \times \text{basic salary.}$$

4) calculate the incentive percentage into amount by using this formula

$$\text{incentive_amount} = \frac{\text{incentive percentage}}{100} \times \text{basic salary.}$$

5) sum of the gross salary equal basic salary, bonus amount + incentive amount

6) display the gross salary 7) End

Flow chart

~~km~~ swap the two number.

Algorithm

- 1) start
- 2) Take input from the user.
- 3) Take temporary variable which to store the value.
- 4) store a value in the temporary variable.
- 5) now a equal to b and b equal to temper variable which store a value.
- 6) display the swapped a and b values
- 7) end

Algorithm flow chart

$$a = a * b$$

$$b = a // b$$

$$a = a // b$$

Control-flow statements

Control-flow statements are used to control flow of the statement execution.

They are 3 types of conditional-flow statements. They are:

1) Conditional statement

2) Loops

3) Jumping statement.

1) Conditional statement

→ Are used to take decision in programming based on conditions.

this condition can be True (or) false

✓ use (if) statement which indicates specific statement belongs to specific block.

write a program given number is equal to 10.

if

```
a = int(input("enter the number"))
```

```
if a == 10:
```

```
    print("number equal to num")
```

```
print("program ended").
```

Algorithm

- 1) start
- 2) take the input of number user.
- 3) check the ~~eq~~ given number equal to ~~eq~~ 10
- 4) when true it print the true and
- 5) display the output $\rightarrow$ end.
