

① write a program to check given number is 10 (or) not

input : any number of the user.

process : $n == 10$

True

 print (n is equal to 10)

False

 print (n is not equal to 10)

Algorithm.

- 1) Start
- 2) Take the input from the user.
- 3) Check the given number equal to 10
- 4) If number equal to 10 ~~print~~ ~~display~~
- 5) ~~display~~ the output in if block.
- 6) If number ^{not} equal to 10
- 7) display the output in the else block

Flow chart

2) write a program to check give number positive (or) negative.

Input $\div$ number

process $\div$ check the number > 0 is positive
else: negative

output $\div$ The point the number is positive (or) negative

Algorithm

- 1) Start
- 2) Take the input from the user
- 3) check the given number is greater than 0 (or) not.
- 4) If number > 0 display output of positive value in if statement
- 5) number < 0 display output in negative value in else statement

Flowchart

write the program to check the biggest number among two values.

Input : Take 2 input from the user.

process : check the given first number greater than second number.

compare the two values.

output : print the biggest number as output.

Algorithm

- 1) Start
- 2) Take 2 input from the user.
- 3) Start-If
- 4) If check the condition
 - if $n_1 > n_2$ print the 1st block print statement
 - else print the 2nd block print statement
- 5) display the output based based on condition
- 6) end.

flow chart

write the program to check the given number is even (or) odd.

→ Algorithm

1) start

2) take input from user.

3) check the given number is divided 2 or

when remainder == 0 print the If block.

when remainder != 0 print the else block

4) display the output even (or) odd number.

flow chart

write a code check is give alphabet is equal vowel (or) not.

1) start

2) Take ~~str~~ input string from the user.

3) check the input equal to A (or) E (or) I (or) O (or) U

4) if given alphabet equal A (or) E (or) I (or) O (or) U then print the If block.

5) print the If block print statement.

6) if given alphabet not in A E I O U.

7) print the else block print statement

8) display the output based on which

9) end.

Flowchart

write the code check give value is alphabet (or) not.

10. Algorithm

1) start

2) Take input string from the user.

3) check the condition is True (or)

→ give Input is $a \geq 'A'$ and $a \leq 'z'$ (or)
 $a \geq 'a'$ and $a \leq 'z'$

→ if Input is a True

→ print the give value is alphabet

→ Input is false

→ print the give value is not alphabet.

Flowchart
